

SYSTEM AND METHOD OF PLANNING A FUNERAL

Abstract of the Disclosure

An apparatus, computer-implemented method and program product to arrange and fund a funeral or other memorial service. A program receives user input requesting information associated with funeral products, services and homes. The program associates the user input with a budgetary, profile, home locator, or step-based parameter. Each parameter logically links to an information field stored within the database. A central web server retrieves information associated with the parameter for inclusion within a funeral plan.
